

PROJECT REPORT

done by

SUDHARSAN M

SMART IRRIGATION SYSTEM BASED ON IOT

as a part of

RSIP-2020 (July 15th,2020 - August 12th,2020)

conducted by

SMARTBRIDGE
Let's Bridge the Gap

1. INTRODUCTION

1.1 Overview:

Agriculture is the backbone of our country. Many primitive methods are still in use across many parts of the country. As demand for agriculture increases, at the same time use of upcoming technologies also increasing. This increasing demand on both sides is lead to develop of systems that are really helpful to the farmers in agricultutal lands.

1.2 Purpose:

There are various purpose involved in making Smart systems. As far as this project is concern, **Smart Irrigation system is deployed in order to make things automatic at remote access.** One cannot sit adn monitor 24 hrs in the field as we are in 21st Century, we involve in many other working fileds too. And also this will make the users to control various lands to access from one single source. Overall **Smart Irrigation system will play a major role in managing and monitoring of agricultural fields.**

2. LITERATURE SURVEY

2.1 Existing problem:

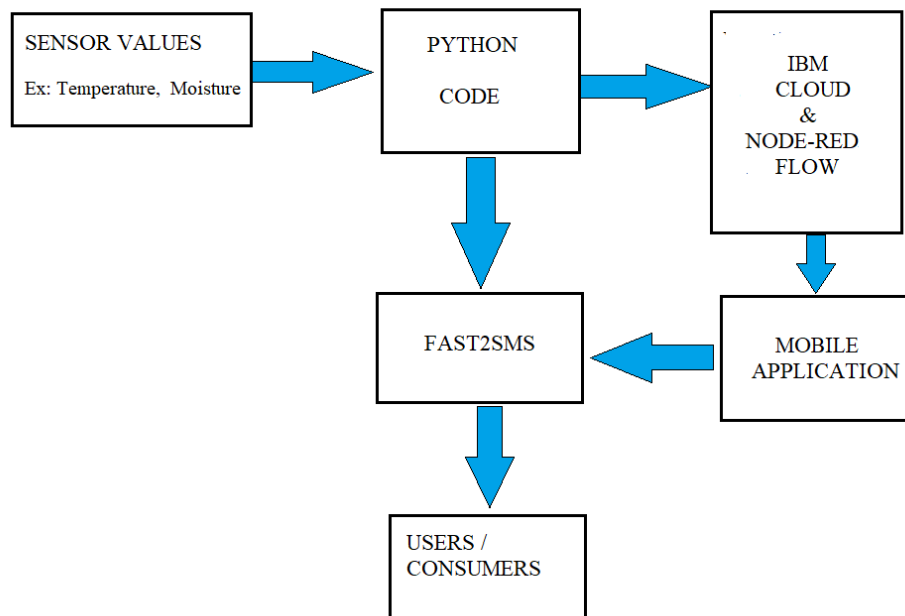

There are many problems associated with the present system. Many rural areas are still deployed with only Manual Irrigation system. Even though many large lands are associated with Smart Irrigation, there also problems still existing. Impacts like **reduced river flow, over usage of water, no proper monitor of crops** etc. And because of these impacts, it even lead to loss of money, more paying of electricity bills etc are also raising. This makes the farmers becoming less in wealth as well as our country's economy on Agriculture will also reduce.

2.2 Proposed Solution:

In this Smart Irrigation system, **Internet of Things (IoT)** which is one the emerging technology is deployed in irrigation of agriculture crops. Using data from OpenWeather, we integrate IBM Node-Red Platform with the MIT App Inventor and Fast2Sms to send alerts to the user about the usage of water in a justified way.

3. THEORITICAL ANALYSIS

3.1 Block Diagram:

3.2 Hardware / Software Designing :

IBM : Acts as a platform to create Node-Red flow. IBM Cloud is used to retrieve obtained data from OpenWeather website through Python Code. Overall, this acts as an integrated platform for all processes involved.

NODE-RED: Platform which is available within the IBM Platform. It is used to design the flow process by installing and deploying various nodes such as IBM_IoT node, function nodes etc. Dashboard nodes are also available to design UI dashboard to view the real-time values.

PYTHON(IDLE): Platform in writing the code to get data from OpenWeather website and to send SMS to the user through Fast2Sms website.

FAST2SMS: It helps in sending alert messages to multiple users at one instance of time.

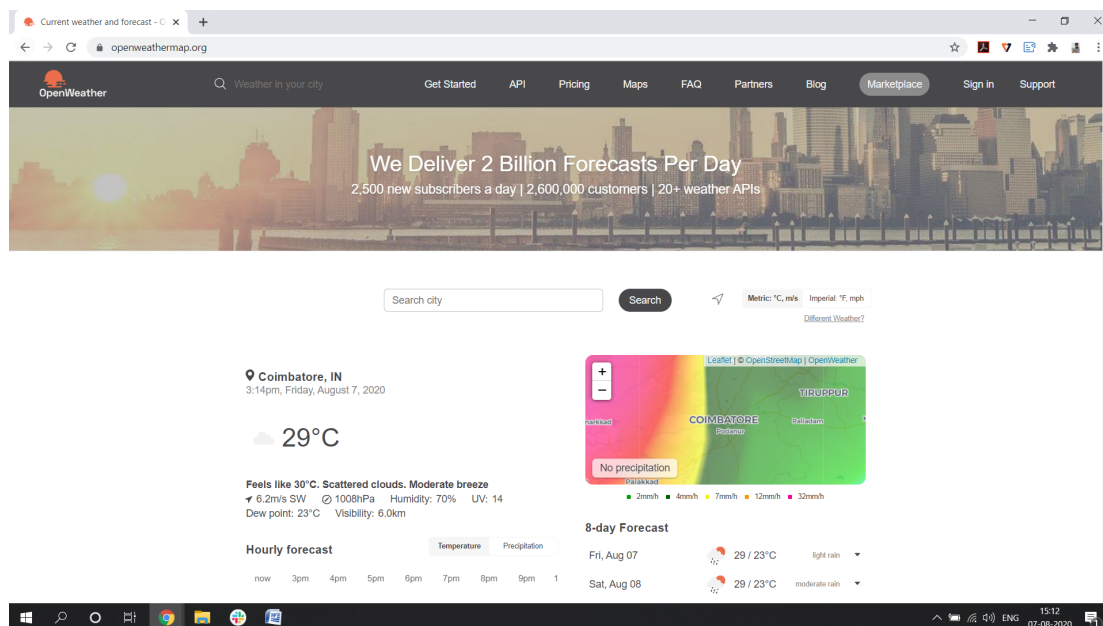

OPEN WEATHER PLATFORM: This platform has the information about weather and in-built API's to use and access the data within it.

MIT APP INVENTOR: This platform is used to build a model APK file using various blocks. The created APK file can be used to get data from IBM Cloud to display in the created Mobile App.

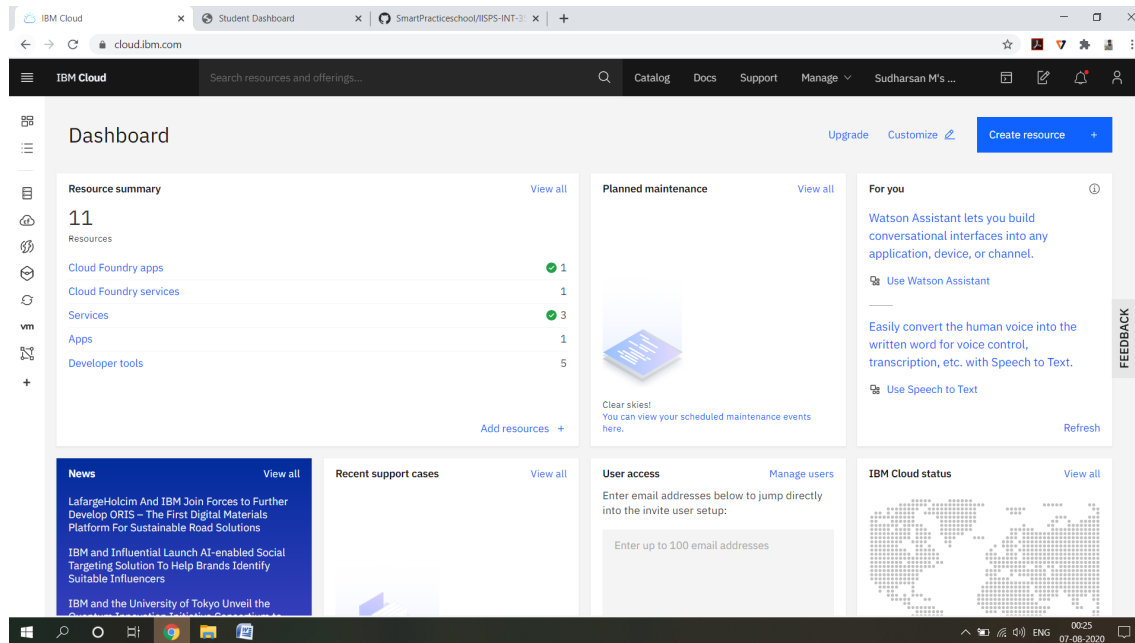

4. EXPERIMENTAL INVESTIGATIONS

IBM IoT platform is used to create several services and applications. It helps to store the data and retrieve it whenever required. Open Weather website will send the real time values of a particular location to IBM cloud through python code written in IDLE shell. Using Node-Red platform in IBM, various nodes are created. Dashboard nodes are created to design UI interface. IBM IoT nodes are deployed so as to connect to the virtual device. The data created in Node-Red platform will be of .json format. Then model APK file is created in MIT App Inventor. In that using https requests nodes in Node-Red, the data from IBM cloud is retrieved and displayed in the created Mobile Application. If the value of moisture content decreases, the Fast2Sms platform will alert the user to turn ON the Motor for irrigation of the crops. The motor can be turned ON using the Mobile application created in MIT App inventor.

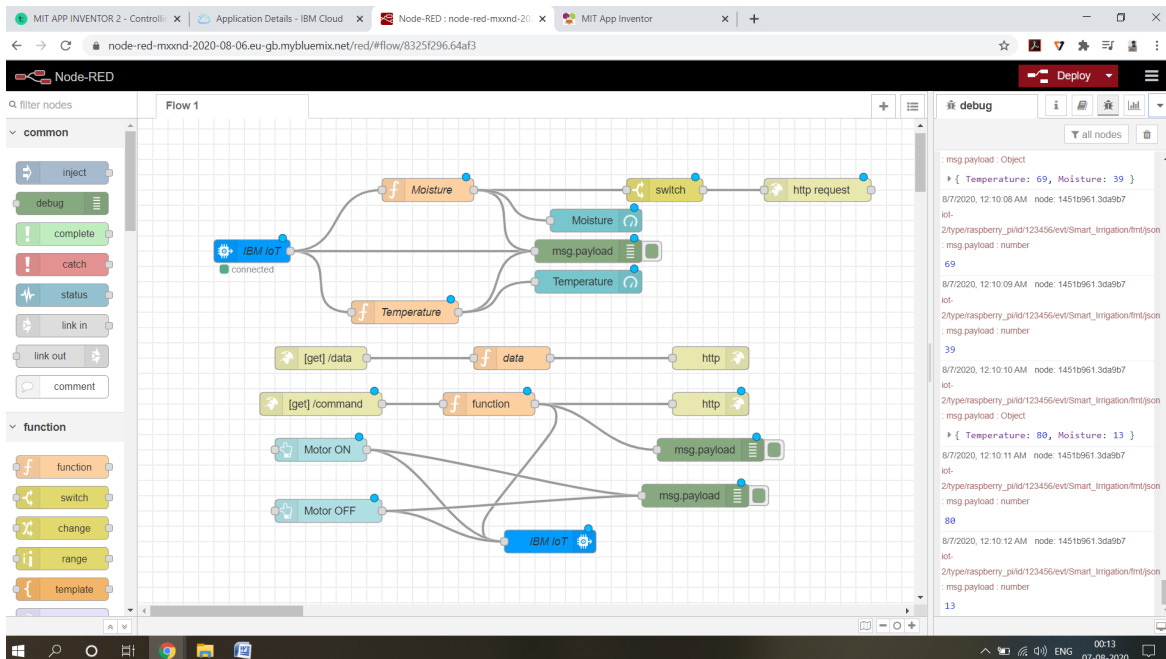

4.1 OPEN WEATHER PLATFORM:

4.2 IBM CLOUD DASHBOARD

4.3 NODE-RED FLOW:

4.4 IBM IOT PLATFORM:

The screenshot shows the IBM Watson IoT Platform dashboard. The top navigation bar includes 'Browse', 'Action', 'Device Types', and 'Interfaces'. A table lists devices with columns: Device ID, Status, Device Type, Class ID, Date Added, and Descriptive Location. The first device is '123456', status 'Connected', type 'raspberry_pi', class 'Device', added on 'Jul 25, 2020 4:20 PM'. Below the table, the 'Recent Events' tab is selected, showing a table of events with columns: Event, Value, Format, and Last Received. The events are for 'Smart_Irriga...' with values like '{\"Temperature\":70,\"Moisture\":16}' and format 'json'.

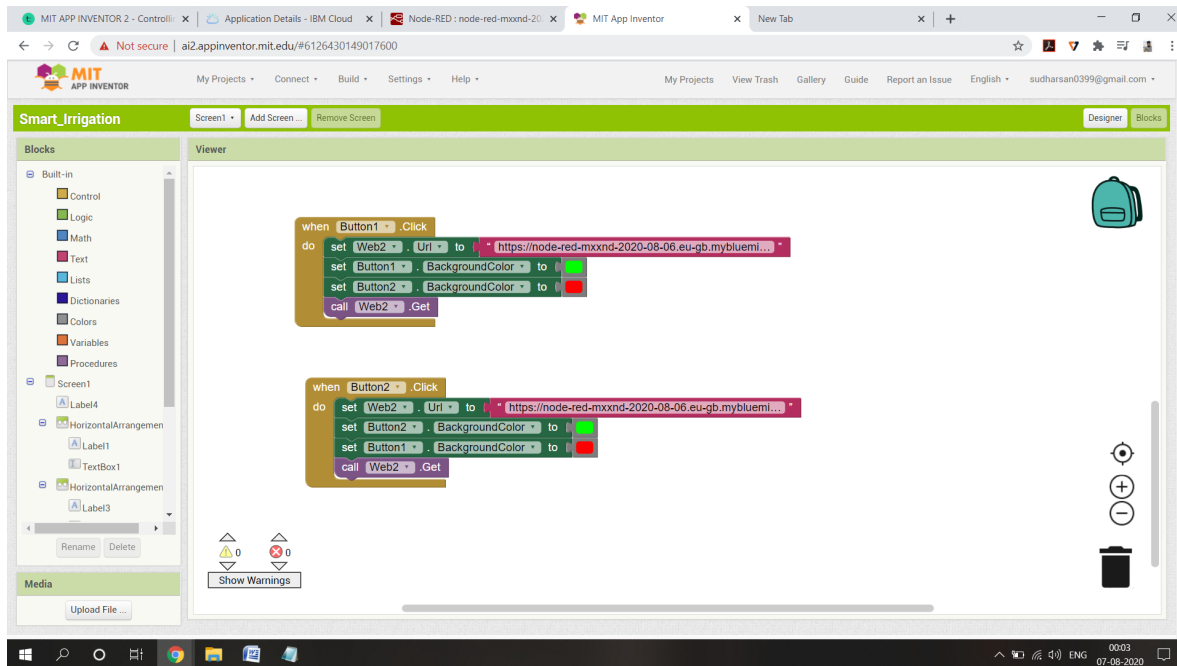

Device ID	Status	Device Type	Class ID	Date Added	Descriptive Location
123456	Connected	raspberry_pi	Device	Jul 25, 2020 4:20 PM	

Event	Value	Format	Last Received
Smart_Irriga...	{\"Temperature\":70,\"Moisture\":16}	json	a few seconds ago
Smart_Irriga...	{\"Temperature\":79,\"Moisture\":38}	json	a few seconds ago
Smart_Irriga...	{\"Temperature\":44,\"Moisture\":13}	json	a few seconds ago
Smart_Irriga...	{\"Temperature\":70,\"Moisture\":40}	json	a few seconds ago
Smart_Irriga...	{\"Temperature\":36,\"Moisture\":38}	json	a few seconds ago

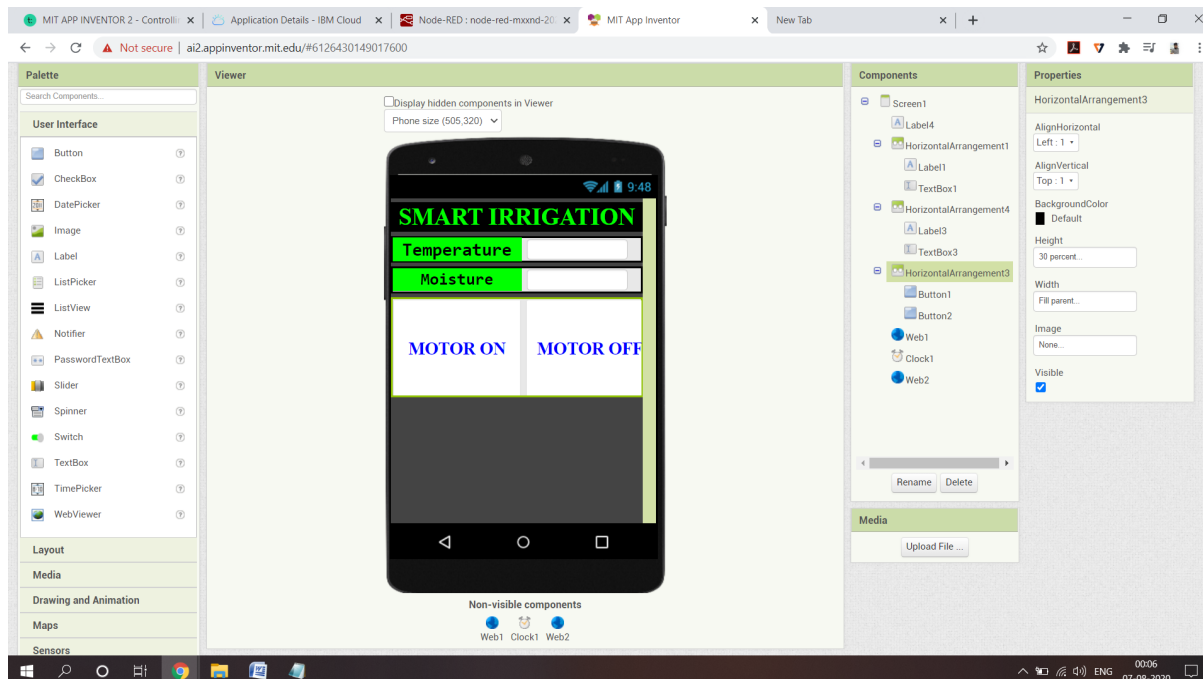

4.5 MIT APP INVENTOR- BLOCKS-1:

The screenshot shows the MIT App Inventor interface for a project named 'Smart_Irrigation'. The left sidebar contains 'Blocks' (Built-in, Control, Logic, Math, Text, Lists, Dictionaries, Colors, Variables, Procedures) and 'Media'. The main workspace shows a 'when Clock1.Timer' block with a 'do' block containing 'set Web1.Uri to https://node-red-mxxnd-2020-08-06.eu-gb.mybluemix...' and 'call Web1.Get'. Below this is a 'when Web1.GetText' block with a 'do' block containing 'set TextBox1.Text to look up in pairs key temperature', 'call Web1.JsonTextDecode', 'get responseContent', 'set TextBox3.Text to look up in pairs key moisture', 'call Web1.JsonTextDecode', and 'get responseContent'. The right sidebar shows 'Designer' and 'Blocks' tabs.

4.6 MIT-APP INVENTOR BLOCKS-2:

4.8 SMART IRRIGATION APP:

4.9 FAST2SMS ALERT MESSAGE:

5. FLOW CHART

6. RESULT

Hence, using the obtained value from OpenWeather platform, the parameters are assessed and the alerts are sent to the user using the Fast2Sms service to the registered mobile. Thus it will lead to proper irrigation of crops and also save water and used only when needed.

7.1 ADVANTAGES:

- Smart Irrigation system prevents unnecessary use of water
- Useful in places where water scarcity is problem
- Users can monitor the weather conditions and increase in economy of production

7.2 DISADVANTAGES:

- The system requires availability of Internet
- Small errors in data/sensor values will influence is production

8. APPLICATIONS:

- Residential Applications such as gardening
- Smart Greenhouse
- Agricultural Fields
- Golfs, turfs.

9. CONCLUSION:

A Smart Irrigation System prevents unnecessary loss of water and provides the information about the current weather conditions. This project alerts the End User whenever it is required and thereby creating a chance for better irrigational facilities and a chance for having better agricultural produce.

10. FUTURE SCOPE:

Better is the Irrigation - better will be the Agriculture. As we are already suffering with severe global warming and scarcity of water, we have a great responsibility of providing a better amount of water resources and irrigational facilities to our younger generations. Smart Irrigation System directly or indirectly plays a prominent role in doing so.
